Don't Panic

Don't get stressed by the fear of getting swine flu. Stress can undermine your immune system. The flu doesn't kill everyone and in most cases may prove benign. Good rest, Moderate exercise, Meditation, Yoga, Pranayam and Healthy Nutritious Diet can help keep your immune system in good condition and able to ward off any infections. Not every 'infection' becomes a full blown 'disease'. Most infections are taken care of by your body even before you know that you were infected. Most infections affect gravely those people who are vitally deranged. So instead of panicking about the flu, stay calm and focus on becoming a healthy 'you'. This is a good time to recommit to your own healthy lifestyle, ensuring that you are getting enough rest, eating healthy life-supporting foods, and engaging in practices that reduce the harmful effects of stress on the immune system.

Keep in mind that if the VIRUS/Bacteria can mutate and become more virulent, then so can you boost your immune system.

What is swine flu?

It's caused by a new swine flu virus that has changed in ways that allow it to spread from person to person -- and it's happening among people who haven't had any contact with pigs. That makes it a human flu virus. Official it is known as Novel influenza A (H1N1) and the virus is A (H1N1) Virus

More details: WebMD

Swine flu virus now most prevalent strain of flu: WHO

Key Points:
- Evidence from multiple outbreak sites demonstrates that the A(H1N1) pandemic virus has rapidly established itself and is now the dominant influenza strain in most parts of the world," said the WHO in a statement.

While 90 percent of severe and fatal cases occur in people aged above 65 in seasonal flu, most of those who die from swine flu are under the age of 50.
- A "very severe form of disease" affecting the lungs and causing severe respiratory failure among young and healthy people was reported, WHO said, adding that highly specialized care was required.
- Large numbers of such patients could therefore "overwhelm" intensive care units and disrupt the provision of care for other diseases, it warned.
- The UN health agency reiterated that pregnant women and those with medical conditions such as asthma, cardiovascular disease and diabetes count among the most vulnerable to the flu.

Swine flu cases may hit 1 crore in December

Taken from DNA

Key Points
- Flu is on the upswing, and by December the numbers of those testing positive could cross one crore. Flu cases will will rise dramatically as winter nurtures the virus. The numbers could hit 1.5 million by mid-November before climbing to over a crore by the end of 2009.
- Epidemiologists in Delhi and they confirmed that the real spike in H1N1 cases will happen by November-December. The steep climb is in line with the World Health Organisation's projection that 30% of the world's population will be infected by the H1N1 virus during the current pandemic.

What are the symptoms of Swine Flu?

Swine Flu Symptoms
In children emergency warning signs that need urgent medical attention include:

Free Guide Swine Flu
● Fast breathing or trouble breathing
● Bluish or gray skin color
● Not drinking enough fluids
● Severe or persistent vomiting
● Not waking up or not interacting
● Being so irritable that the child does not want to be held
● Flu-like symptoms improve but then return with fever and worse cough

In adults, emergency warning signs that need urgent medical attention include:

● Difficulty breathing or shortness of breath
● Pain or pressure in the chest or abdomen
● Sudden dizziness
● Confusion
● Severe or persistent vomiting
● Flu-like symptoms improve but then return with fever and worse cough

Swine Flu Preventive Measures 1

- Use a tissue/handkerchief when you cough or sneeze.
- Wash your hands thoroughly and often, especially after sneezing or coughing, using soap and water.
- Wipe surfaces like door-knobs using a regular cleaner. Virus remains on hard surfaces for 2 to 8 hours.
- If you’re sick with flu-like symptoms, go to the doctor.
- Avoid close contact with people who might be ill (Unless you need to take care of the ill yourself) and avoid crowded places.
- Respirators should be considered for use by individuals for whom close contact with an
infectious person is unavoidable. This can include selected individuals who must care for a sick person (e.g., family member with a respiratory infection) at home.

- **Avoid touching your eyes, nose or mouth without washing your hands.** Germs spread this way.

### Catch it Bin it and Kill it video

**UK Swine Flu Ad - Catch It, Bin it, Kill It**

Swine Flu Preventive Measures 2

- **Cover your mouth and nose with your upper sleeve (not your hands)** if you do not have a tissue and need to cough or sneeze.
- Cover your mouth and nose with a tissue when you cough or sneeze; **put the used tissue in a waste basket** and clean your hands.
- Clean your hands as soon as possible after coughing, sneezing, or blowing your nose.
- Use soap and water and **wash your hands for 15 - 20 seconds**; or
- **Use alcohol-based hand wipes** or alcohol-based (60-95% alcohol) gel hand sanitizers; rub these on the hands until the liquid or gel dries.
- Clean your hands often when you or others are sick, especially if you touch your mouth, nose, and eyes.
- **Always clean your hands before eating.**
- **Carry alcohol-based hand wipes** or alcohol-based (60-95% alcohol) hand-sanitizing gels with you to clean your hands when you are out in public.
- Teach your children to use these hygiene practices because germs are often spread at school.

Swine Flu Guide Lines

With swine flu cases continuing to rise sharply, the Union Health Ministry on Saturday issued fresh guidelines specifying screening and testing module for patients to contain the disease in the country. The guidelines were finalized at a high-level meeting chaired by the Health Minister Ghulam Nabi Azad last night in connection with the various actions taken by the government for containment and mitigation of H1N1 cases across the country.

During the meeting that lasted for more than five hours till 10 pm last night, the Health Minister also discussed various guidelines and protocols developed by the World Health Organisation in Geneva, Center for Disease Prevention and Control, Atlanta, USA and National Health Service, United Kingdom. The meeting was attended by eminent experts from public and private hospitals/organizations besides senior officers of Health Ministry and Directorate General of Health Services.

As per guidelines, all individuals seeking consultation for flu-like symptoms would be screened at health care facilities -- both government and private -- or examined by a doctor and will be categorized broadly under three categories A, B and C depending on their health status, as per an official release here.

Category-A.
They will be given treatment and isolated as specified in the guidelines. Patients with mild fever plus cough/sore throat with or without body ache, headache, diarrhoea and vomiting will be categorized as Category-A. They do not require Oseltamivir (Timiflu) and should be treated for the symptoms mentioned above.

These patients should be monitored for their progress and reassessed after 24 to 48 hours by the doctor. For this category, no testing of the patient for H1N1 is required. Patients should confine themselves at home and avoid mixing up with public and high risk members in the family.

Category B
Category B has two subcategories. Category BI is for those patients, who have high grade fever and severe sore throat in addition to all the signs and symptoms mentioned under Category-A. They may require home
isolation and Oseltamivir (Tamiflu).

**Category BII** is for those, who have in addition to all the signs and symptoms mentioned under **Category-A** are having one or more of the following high risk conditions like children less than 5-years-old, pregnant women, persons aged 65 years or older, patients with lung diseases, heart disease, liver disease, kidney disease, blood disorders, diabetes, neurological disorders, cancer and HIV/AIDS, patients on long term cortisone therapy. They shall be treated with Oseltamivir (Tamiflu) but no tests for H1N1 is required for Category-B (I) and (II).

However, all patients of Category-B (I) and (II) should confine themselves at home and avoid mixing with public and high risk members in the family.

**Category C**
In Category C, those patients fall, who in addition to the above signs and symptoms of Category-A and B, have one or more of the following problems like breathlessness, chest pain, drowsiness, fall in blood pressure, sputum mixed with blood, bluish discoloration of nails, irritability among small children, refusal to accept food, worsening of underlying chronic conditions. All these patients mentioned above in Category-C require testing, immediate hospitalization and treatment.

The release said that these guidelines will be reviewed and revised from time to time as per need and on the basis of spread of the disease.

Help Stop World Hunger without spending a Penny
To provide, using the Internet, staple food to chronically hungry Indians so as to enable them to survive, learn and work. Bhookh.com is the India's first online activism site. It gives Internet users the daily opportunity to quickly make a difference to feed Indians who are dying of hunger. In less than 5 seconds, visitors can click on the "Give Free Food" button and, at no cost to them, send food to the hungry. The staple food is paid for by Bhookh.com sponsors. Times Of India

The Hunger Site
The Hunger Site is the original click-to-donate site created in 1999 that gets sponsorship from advertisers in return for delivering users who will see their advertisements. The Hunger site encourages visitors to click a button on the site, once per day, asserting that each unique click results in a donation "equivalent" to 1.1 cups of food. The Hunger Site is not a charity; it is a for-profit corporation which donates the revenue from its advertising banner to selected charities. Currently, these are Feeding America (formerly America's Second Harvest) and Mercy Corps.
